Problem 1 3 points

Write a bash script that takes positional parameters. The input reads a string. The script displays one of two things

1. The position of that string in the positional parameters
2. Display “NULL” if the string is not one of the positional parameters

For example (red is the user input, blue is the output)

```
% bash labtest1_1B.sh this is the list
the
% 3
```

Since the third positional parameter is “the”

File name: labtest1_1B.sh

Problem 2. 4 points

Write a bash script that reads two integers (n and m). If these two numbers could be the sides (legs) of a right-angle triangle with integer hypotenuse or not. Just display YES or NO

File name: labtest1_2Bs.h

Problem 3. 3 points

Write a shell script that reads from the standard input a file name. It checks if this file does exist in the current directory or not.

- If the file does exist, and is a directory, display “This file is a directory”
- If the file does exist and is not a directory, display “This file does exist and has m lines (where m is the number of lines in the file)
- If the file does not exist, display “This file does not exist”

Filename: labtest1_3B.sh

Problem 4. 5 points

Read integers from the standard input each integer on a separate line. The input sequence should be increasing in magnitude and alternating in sign (1, -3, 4, -6, 8, -12, 15,)

The script terminates when this pattern is broken and display the offending integer (note that the sequence might start with a positive or negative number).

Filename: labtest1_4B.sh

Problem 5. 5 Points

Consider a file that contains records. Each record consists of the following fields separated by a tab

product name: Any sequence of letters and spaces

Product ID: A sequence of alphanumeric symbols with no white spaces.

Inventory: An integer that shows the inventory for that product

Last week orders: The number of units ordered last week (integer)

The name of the file is B.txt. The program checks the file for products that we should order soon.

- If the inventory is less than what was ordered last week, display “Urgently order **Product ID**”
- If the inventory is less than double what was ordered last week, we should display “We should order **Product ID** soon” (where product ID is the product ID for that product)
- Otherwise, do not display anything

File name labtest1_5B.sh
