Problem 1 4 points

Write a bash script that takes positional parameters. The input reads an integer. The script displays one of two things

1. The positional parameter with the number that you read. For example if you read 2, you display the second positional parameter
2. Display NULL if the number you read is greater than the number of parameters

File name: labtest1_1A.sh

Problem 2. 3 points

Write a bash script that reads an integer (n) and display the square of n (assume that n is less than 20). If the number you read does not give an even squared number, display "n square is not even" without the quotes, where n is the number you read.

File name: labtest1_2A.sh

Problem 3. 3 points

Write a shell script that displays the number of total files (that includes directories) in the current directory and the number of executable files (not directories)

The output should be as follows
The number of total files = n
The number of executable files = m

Filename: labtest1_3A.sh

Problem 4. 5 points

Read integers from the standard input each integer on a line until you read an integer (a) that is greater than the sum of the previous two integers. Then you stop and display that integer (a)

Filename: labtest1_4A.sh

Problem 5. 5 Points

Consider a file that contains records. Each record consists of the following fields separated by a tab

product name: Any sequence of letters and spaces

Product ID: A sequence of alphanumeric symbols with no white spaces.

Inventory: An integer that shows the inventory for that product

The program reads two integers on the same line from the standard input. The first is the threshold, the second is the tolerance. The program prints a list of products with inventory within tolerance from threshold. For example if the two integers are 9 , 2. Then the program lists on the standard output all the product with inventory between (and including) $9-2$ to $9+2$ (i.e. items with inventory of 7, 8, 9, 10, and 11.

The information printed is

Product ID: Product name

Each product on a separate line. If no products satisfy this, do not print anything

File name labtest1_5A.sh
